

## What's New 'Cliff Notes'

### Equinix Precision Time 2021.4

Equinix Precision Time 2021.4 provides even more reliable time synchronization for our virtual customers by offering a Fabric port redundancy option, as well as added connectivity through Network Edge.

#### Port Redundancy Now Supported

With this release, Equinix Precision Time supports a port redundancy option for increased reliability and improved availability. Customers can configure one Fabric port as a primary connection to the Precision Timing service, with another Fabric port as a secondary, backup connection. In addition, now customers can configure a primary virtual device and a secondary, backup virtual device, both within Network Edge topology.

#### Network Edge Integration

Network Edge customers can now connect to Equinix Precision Time services using Network Edge instead of an Equinix Fabric physical port. This enables our Network Edge customers to precisely synchronize their timing services from within their Enterprise infrastructure, including remote locations and Cloud deployments, even if they don't have a physical presence in our IBX data centers.
