

## What's New 'Cliff Notes'

### Equinix Identity Access Management 2022.3

With this release, Equinix Identity Access Management introduces unified login pages throughout Equinix product portals, along with a single sign-on feature that allows for convenient switching between select portals. The 2022.3 release also adds the Company Profile resource and the Fabric Service role that defines a set of access permissions. This release features the inventory of unassigned assets and the option to assign them to projects. In addition, this release enables resellers to merge end-customer organizations and share assets with their end-customers.

#### Unified Login Page and Single Sign-On

All Equinix Portals (excluding Equinix Metal) feature a unified login page. Once you log in, you can navigate between select portals without having to re-login.

#### Unassigned Assets

Assets that were ordered offline or ordered through legacy processes, not through Equinix Identity Access Management enabled tools, are listed on the Resources page under the Unassigned Assets tab. From here, you can assign these assets to projects.

#### Company Profile

The Company Profile entity is now included as a resource in the resource hierarchy along with a corresponding role.

**Role:** Fabric Service

**Permissions:**

- fabric.companyprofile.read
- fabric.companyprofile.create

- fabric.companyprofile.update
- fabric.companyprofile.delete

## **Shared Resources**

Resellers can share assets with their end-customers. Shared assets are available in reseller and end-customers projects.

## **End-Customers Merging**

Merging end-customers organizations helps you optimize your resource hierarchy structure. This process creates a new parent organization and moves selected end-customers organizations to the new entity.
